DAIKIBO IOT MACHINE HEALTH ANALYSIS

EXECUTIVE SUMMARY

Key Business Insights

- **160.7K** machine records analyzed across all factories.
- **99.94%** of machines are healthy (**160,601**), with only **103** unhealthy machines.
- **Daikibo-Berlin** records the highest healthy machine count (**40,174**).
- **Section-3** handles the highest machine volume (**62,451** healthy machines).
- **Laser Welder (46.6%)** and **Laser Cutter (41.8%)** account for **88%+** of all machine failures.
- Average operating temperature remains stable at **24.99°C**, indicating consistent machine performance.
- **Japan** has the highest machine volume (**80,293** healthy machines).

Recommendations

- Prioritize **Laser Welder** and **Laser Cutter** for preventive maintenance since they account for **88%+ of total failures**.
- Implement scheduled inspections for **Section-3**, as it handles the largest machine workload.
- Maintain the current temperature range around **25°C** to ensure stable machine performance.
- Continue the current maintenance strategy because the organization has achieved an overall machine health rate of **99.94%**.
- Introduce automated alerts for unhealthy machine status to reduce response time and prevent unexpected downtime.
- Track monthly failure trends by factory and device type to identify issues before they impact production.

Conclusion: The analysis of **160.7K** machine records shows an excellent **99.94%** machine health rate, with only **103** unhealthy machines detected. The dashboard enables quick identification of high-risk device types and supports data-driven maintenance decisions to improve operational efficiency and minimize downtime.
